**DETAILED ACTION**

***Allowable Subject Matter***

1. The following is an examiner's statement of reasons for allowance:
2. With respect to independent claim 18, the prior art either alone or in combination teaches:

an optical cursor control device including a worktable and an optical pointing device moved on the worktable by an operator, the optical pointing device comprising:

a case;

a light guide disposed at a sidewall of the case, one portion of the light guide being a protrusion upwardly protruding from the sidewall of the case, the one portion of the light guide being exposed to an external environment outside the case, another portion of the light guide extending from the sidewall of the case to an interior of the case by a predetermined length, the other portion of the light guide being exposed to an internal environment inside the case, the light guide directly accepting the external lights through the protrusion to obliquely irradiate lights penetrating the light guide onto a surface of the worktable through an opening formed in a lower panel of the case;

an optical sensor disposed in the case and over the opening to detect lights reflecting from the surface of the worktable; and

a printed circuit board with electronic parts processing an output signal of an optical sensor to generate an output signal that corresponds to a position of the case.

3. The prior art either alone or in an obvious combination does not teach, in addition to the above limitations, wherein the light guide has a specific taper shape for acting as

a light amplifying means, diameters of the one portion and the other portion being different in size from each other.

4. With respect to independent claim 23, the prior art either alone or in combination teaches:

an optical cursor control device having a worktable and an optical pointing device moved on the worktable by an operator, the optical pointing device comprising:

a case;

an optical sensor disposed in the case;

a light guide on an outer sidewall of the case and including first and second surfaces respectively on predetermined portions of the light guide,

the first surface being spaced away from the case and accepting light reflecting from a surface of the worktable adjacent to the case, and

the second surface of the light guide being adjacent to the case and introducing the light penetrating the light guide onto an optical sensor in the case, the first and second surfaces including one optically functioning material, and a remaining portion of the light guide including optically different functioning material from the first and second surfaces; and

a printed circuit board with electronic parts processing an output signal of the optical sensor to generate an output signal that corresponds to a position of the case,

wherein the first and second surfaces are in direct contact with and are supported by the remaining portion of the light guide, and

wherein the light sequentially traverses the first surface, the remaining portion and the second surface of the light guide.

5. The prior art either alone or in an obvious combination does not teach, in addition to the above limitations, wherein the light guide protrudes from a closed case and a first surface of the light guide is spaced away from the case, being located outside the outer sidewall of the case.

6. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
